Summary

Passionate Frontend Flutter Developer with hands-on experience in designing and developing interactive, scalable mobile applications. Currently a fifth-year Information Technology Engineering student specializing in Artificial Intelligence at Damascus University. I combine a solid academic foundation in AI algorithms, Neural Networks, and Object-Oriented Programming (OOP) with practical software engineering skills. Highly motivated to translate theoretical knowledge and algorithmic logic into highly efficient, real-world software solutions.

Technical Skills

Programming Languages: Python, Dart, C++, Java

Frameworks & Libraries: Flutter, Three.js

Engineering Concepts: Artificial Intelligence, Neural Networks, Algorithms & Data Structures, Object-Oriented Programming (OOP), UI/UX Design

Mobile Development (Flutter): Offline-First Architecture, State Management (ValueNotifier, Riverpod), Networking (Dio, Interceptors, JWT, WebSockets), Custom Widgets, Dynamic Theming, RTSP Streaming

Databases & Local Storage: SQLite (sqflite), SharedPreferences, Local Caching, Data Synchronization

Languages: Arabic (Native), English (Intermediate)

Projects

MyHalaqat – Quran Memorization & Circle Management App

2026

Frontend Flutter Developer

Flutter, Dart, SQLite, Dio, Workmanager

- Engineered an offline-first mobile architecture utilizing local SQLite databases to cache student records and queue pending transactions during network disconnection.
- Implemented automated, reliable background synchronization using Workmanager paired with custom exponential backoff retry algorithms to handle network instability and reconnects seamlessly.
- Adopted Clean Architecture principles by separating the application into distinct layers (Core, Features, Services, Screens) for maintainability, managing UI reactive state efficiently with ValueNotifier.
- Built a secure networking layer using the Dio HTTP client integrated with custom Interceptors for JWT authorization, silent token refreshing, and robust error handling.
- Designed interactive teacher dashboards to track attendance, daily memorization, and student evaluations, incorporating custom reusable widgets, dynamic Light/Dark theming, and Shimmer loading effects.

Digital Guard – AI-Driven Security & Access Control System

2026

Flutter Developer

Flutter, Riverpod, Dio, WebSockets, MediaKit (RTSP)

- **Scalable Architecture:** Engineered a comprehensive mobile security application using Flutter, implementing Riverpod for robust, reactive state management and dependency injection.
- **Live RTSP Streaming:** Integrated media_kit to establish and render real-time RTSP video streams from multiple security cameras directly within the application.
- **Real-Time AI Events:** Established a secure WebSocket connection to receive live AI facial recognition events, rendering dynamic bounding boxes and critical security alerts as custom overlays on the live video feed.
- **Offline-First Synchronization:** Designed a highly reliable manual verification system (PIN fallback) with a local queue mechanism, ensuring decisions are stored locally during network outages and automatically synchronized upon reconnection.
- **Advanced API Integration:** Handled complex RESTful API integrations using Dio for managing watchlists, guards, doors, and cameras, including robust error handling, token management, and JSON parsing.
- **Complex UI & Features:** Built a responsive, highly customized "HUD-style" UI featuring multi-image picking (for biometric enrollment), complex form validations, and generation of downloadable CSV attendance reports.

Senet – AI Board Game

2026

AI Developer

Python

- Developed a full-featured board game project based on the ancient game "Senet", integrating an intelligent automated opponent.
- Implemented the Expectiminmax decision-making algorithm to evaluate probabilistic game states and predict optimal moves against human players.

Lava and Aqua – Algorithmic Puzzle Game

2026

Python Developer

Python

- Programmed a logic-based computer puzzle game completely from scratch using Python.
- Utilized and applied various advanced search and pathfinding algorithms to efficiently solve complex logical challenges and navigate dynamic in-game obstacles.

GoSwift – Delivery Order Management App

2024 – 2025

Frontend Developer

Flutter, Dart

- Developed the frontend mobile interface for a fast-paced delivery service application, focusing on responsive layouts and a seamless user experience.

Capsula – Pharmacy Management Application

2024 – 2025

Frontend Developer

Flutter, Dart

- Designed and implemented interactive user interfaces for a pharmacy management system aimed at streamlining daily task organization and medicine tracking.

Education

Damascus University

Damascus, Syria

Bachelor of Information Technology Engineering (Specialization: Artificial Intelligence)

Expected Graduation: 2027

- **Relevant Coursework:** Principles of Artificial Intelligence, Neural Networks, Programming Languages, Compilers, Algorithms and Data Structures.
